HIT YOUR NUMBER, EVERY MEAL

Protein Per Meal

Your daily protein target is just the total. The real skill is hitting it **meal by meal** — and that's hardest when your appetite's low. This shows you what a 25, 30, 35 and 40g protein meal actually looks like, how to flex it to **your** exact number, and what to reach for when you can't face food.

WHAT EACH MEAL LOOKS LIKE

The four tiers

25 g per meal

- 1 scoop whey isolate
- 4 large eggs
- 250g fat-free Greek yogurt
- ~85g cooked chicken breast
- 100g tuna (drained)

30 g per meal

- ~100g cooked chicken breast
- 120g lean (5%) beef mince
- 130g salmon fillet
- 250g cottage cheese
- 2 eggs + 1 scoop whey (split)

35 g per meal

- ~115g cooked chicken breast
- 150g white fish + 1 egg
- 135g lean beef mince
- 1.5 scoops whey isolate
- 120g tuna + 100g Greek yogurt

40 g per meal

- ~130g cooked chicken breast
- 130g lean steak
- 175g salmon
- 160g tuna
- 1 scoop whey + 200g Greek yogurt

Rounded, everyday values (cooked weights for meat/fish). Brands vary — check the label and adjust.

FLEX IT TO YOUR EXACT TARGET

Build to any number

Your calculator gave you a per-meal number — say 33g, or 38g. You don't need a new recipe for it. Pick a **base protein**, then **top up** to land on your figure.

THE METHOD

Base + top-up

Start with a protein you like (chicken, mince, fish, yogurt, a shake). Read its protein off the tiers opposite, then add a small top-up from the list to hit your exact number. Two minutes, no maths degree.

ADD THIS	PROTEIN
1 large egg	**+6 g**
30g cheddar	**+7 g**
30g lean deli ham / turkey	**+9 g**
100g fat-free Greek yogurt	**+10 g**
½ scoop whey isolate	**+12 g**
1 scoop whey isolate	**+25 g**

WORKED EXAMPLES

See it in action

Target 33g: 100g chicken (31g) + a knob more, or just weigh 108g. **Target 38g:** 115g chicken (35g) + 1 egg (6g) = 41g, close enough — or 130g chicken. **Target 45g:** 250g Greek yogurt (25g) + 1 scoop whey (25g) when solid food is a struggle. The number is a target, not a test — land near it and move on.

WHEN YOU JUST CAN'T FACE FOOD

Low appetite? Drink it.

When appetite drops, protein is the first thing to fall — and that's exactly when your body starts taking the shortfall from muscle. Liquid protein is your safety net on the tough days.

START HERE

Whey isolate

Fast-digesting, low-volume, low in lactose — about 25g of protein in a scoop that sits light. The easiest way to bank a full meal's protein when you can't stomach a plate. Make it your default backup.

IF WHEY DOESN'T SIT RIGHT

Go clear

Bloated or gassy on whey? Try a **clear / hydrolysed protein** — it drinks like a juice or cordial rather than a milkshake, and it's far lighter on the gut. Same protein, none of the heaviness.

DAIRY-FREE BACKUP

Beef protein isolate

If dairy's the problem full stop, a **hydrolysed beef protein isolate** is dairy-free, also drinks clear, and gives you a clean 20–25g. A solid third option when whey and clear whey both bother you.

HIGH-PROTEIN, LOW VOLUME

Foods that don't fill you

When you can eat but not much: skyr, cottage cheese, egg whites, lean deli meat, tuna, low-fat Greek yogurt. Loads of protein, barely any bulk — perfect for a shrunken appetite.

THREE HABITS THAT MAKE IT STICK

Small changes, big difference

Front-load — get most of your protein in early while appetite's best. **Protein first** — eat the protein on the plate before anything else. **Split it** — more small feeds beat two big meals you can't finish.

THE BIGGER PICTURE

This is the part that protects your muscle

Hitting your protein is half the job — pairing it with the right training is what actually keeps the muscle on while the weight comes off. That's the whole system, built for exactly this.

WANT IT DONE FOR YOU?

The recipes, the training and the tracking — the full self-run system that protects your muscle and keeps your result.
