FREE GUIDE

THE FRAMEWORK

Your starting structure for fitness, health & transformation — the operating states, the macro engine, the training framework and the weekly review loop. Structure over motivation.

START HERE

The Physique Operating System

- **Structure over motivation.** Results come from structure, not motivation. Motivation comes and goes — structure stays. A clear system removes emotional, in-the-moment decisions and replaces them with simple, repeatable actions you can actually measure.
- **The three operating states.** Every plan sits in one of three states. **Maintenance** holds your weight steady and builds your baseline. A **deficit** (eating slightly less than you burn) reduces body fat. A **surplus** (eating slightly more) supports muscle growth. Choose a direction only once you know your baseline.
- **Baseline before direction.** Jumping straight into a deficit with no baseline is guesswork. Maintenance gives you a reference point, and that reference is what makes every adjustment afterwards precise instead of random.

LOCK THESE IN FIRST

Daily Foundations

Before macros and training splits, these four habits decide whether everything else works.

SLEEP

7–9 hours

Poor sleep raises hunger, drops training quality and slows recovery. It is the cheapest performance upgrade you have.

HYDRATION

30–35 ml / kg / day

Most people sit mildly under-hydrated. Hunger is often thirst in disguise.

DAILY MOVEMENT

Steps beat sessions

Steps drive far more of your daily calorie burn than any single workout. Build towards a consistent daily step target rather than chasing one big session a week.

STRESS & CONSISTENCY

Repeatable beats perfect

High stress and an all-or-nothing approach quietly stall progress. You do not need a perfect week — you need a repeatable one.

STEP ONE

Maintenance Calibration

CONTROLLED INPUTS

Fix three things

A calorie target, a daily step target and a set training frequency. If the inputs keep moving, you can never read the results.

OBSERVATION WINDOW

Hold for 7–14 days

Day-to-day weight swings are water, food volume and stress — not fat. Judge the trend, never a single morning.

ADJUSTMENT LOGIC

Small changes only

Weekly average climbing? Drop 100–150 kcal. Falling when you want it steady? Add 100–150 kcal. Small changes keep you in control.

Need your starting calorie number? **Tap here — my free TDEE & macro calculator** works it out in 30 seconds.

STEP TWO

The Macro Engine

- **Protein — your anchor.** Protects muscle and drives recovery. Keep it high and consistent in every phase — it is the one macro you never cut.
- **Fats — your stability.** Dietary fat supports your hormones and general function. Do not slash it too low; aggressive cuts bring fatigue and make the plan far harder to stick to.
- **Carbohydrates — your fuel.** Carbs power your training and recovery. Drop them too far and performance follows. Place most of them around training to get the most back.

EXAMPLE STARTING TARGETS	
Protein	1.6–2.2 g per kg bodyweight
Fats	0.5–1.5 g per kg bodyweight
Carbohydrates	Remaining calories, weighted around training
Protein per meal	30–40 g
Water	30–35 ml per kg bodyweight

Example targets shown — your exact numbers are set to you.

THE PRINCIPLES

Training Framework

MECHANICAL TENSION

Quality of load

Muscle grows from meaningful tension under load through a full range of motion. How you lift matters more than how much you lift.

PROXIMITY TO FAILURE

2–3 reps in reserve

Train most sets 2–3 reps short of failure (2–3 RIR). Save genuine failure for the occasional set, once you are experienced.

PROGRESSIVE OVERLOAD

A little more, over time

More reps first, then more load. Track it so progress is real, not a feeling.

VOLUME PHILOSOPHY

Enough, not everything

Enough stimulus to grow, little enough to recover from. Piling on extra sets adds fatigue, not results.

THE PROGRAMMES

YOUR NEXT STEP UP

The training programmes — done for you.

This guide gives you the principles. **Physique OS** gives you the **structured 3, 4 & 5-day training programmes** — every exercise loaded into your app, a starter set up for you, and progressed rung by rung as you get stronger. You follow it, log it and climb it in one place. **Your next step up from the Framework — £29/month, 7 days free at callumbcoaching.co.uk/start.**

WHEN PROGRESS SLOWS

Adjustment Systems

METABOLIC ADAPTATION

Normal, not broken

Your body burns slightly less as you diet — that is normal. Moderate deficits keep this manageable and progress sustainable.

SCALE INTERPRETATION

Averages, not mornings

The scale reflects water and glycogen day to day. Weekly averages show the real direction.

THE 14-DAY RULE

Stall + consistency first

Only adjust after a genuine stall with 90%+ consistency. Then trim 150–200 kcal — not before.

PERFORMANCE PROTECTION

Lifts crashing? Hold.

Protect your training output. If your lifts are crashing, that is your signal to hold, not to cut further.

STAYING HUMAN

High-Carb Days & Diet Breaks

HIGH-CARB DAYS

A tool, not a reward

Planned higher-carb days refill glycogen and lift performance. Use them as a tool, not a reward for a bad day.

DIET FATIGUE

Moderation keeps you going

Long stretches of restriction wear you down mentally. Building in some moderation keeps you consistent.

DIET BREAKS

1–2 weeks at maintenance

After a long deficit, return to maintenance for 1–2 weeks — keep the structure, just raise the calories. You will come back sharper.

THE LOOP THAT MAKES IT WORK

Weekly Review Protocol

DATA REVIEW

Once a week

Look at your average weight, progress photos, training performance and steps together.

DECISION RULE

One variable

Hold, adjust, or add fuel — and change only one variable at a time.

RESTRAINT

Patience is precision

Reacting to every daily wobble is how people lose control.

LEARN FROM EVERYONE ELSE

Common Mistakes

WHERE PEOPLE GO WRONG

The usual five

No baseline, deficits that are too aggressive, too much volume, reacting to the daily scale, and changing several things at once.

THE FIX

Structure stops panic

Discipline is just controlled repetition. Structure is what stops panic — when in doubt, hold and review.

PUT IT TOGETHER

Operational Summary

Start here — your first 14 days

- **1.** Eat at maintenance and log it honestly.
- **2.** Hit your protein and step target every day.
- **3.** Train 3–4 structured sessions a week.
- **4.** Review weekly averages — do not react daily.

Hierarchy of control: confirm consistency, confirm performance, confirm recovery — then adjust, minimally. **The long game:** consistency compounds. Steady, sustainable execution beats aggression every time.

WORK WITH ME

When You Want It Built For You

THE BLUEPRINT — £99

Own the whole system

Your personalised macros plus the full module set, tracked in the app — recipes, exercise library, lift & cardio tracking. One-off, yours to run.

COACHED — FROM £149

I drive, you follow

Weekly check-ins, coach review and macro adjustments every 2 weeks, all online. Step up to Premium for coached training on top.

READY TO START?

If you want the guesswork taken out and a plan built around your numbers, apply and we will map your first phase together.
